

AI Explain Option Pricing – Executive Pitch

Problem:

Options traders can see prices and Greeks, but they rarely understand why an option is priced the way it is or what is truly driving risk.

Solution:

A Spring Boot microservice that runs Black–Scholes pricing and Greeks, then lets a GPT-4.1-based 'quant mentor' explain drivers of price, risk, and mispricing in clear language.

Value:

- Makes complex derivatives risk understandable for advanced retail and juniors
- Bridges quant outputs and human decision-making
- Easy to integrate as an API into trading or education platforms

Demo Flow:

1. POST an option definition to `/api/options/explain`
2. See theoretical price, Greeks, and mispricing
3. Read the LLM explanation and risk suggestions
